SEE A TENTATIVE AGENDA

Background: The U.S. Army Corps of Engineers, in collaboration with the Ohio River Basin Alliance and numerous partners, recently published the Ohio River Basin Climate Change Report. The report is a pilot study, a first of its kind, to forecast precipitation, temperature and streamflow changes in the Basin, as well as highlighting key opportunities to adapt to those changes.

Meeting: This half-day meeting will focus on the aspects of this report that relate to southwestern Pennsylvania and will provide attendees with a briefing of the findings and projections contained in the report as well as facilitation of audience questions, concerns and ideas. This will include discussions of the following:

- At-risk infrastructure,
- projected changes in precipitation,
- impacts on operations, planning, and policy, and
- discussions among stakeholders who are incorporating these findings into near and long-term planning.

Who should attend? This presentation will be geared towards stakeholders and decision makers involved in municipal operations, authority operations, land use planning, water resource management, businesses with critical interest in water transportation and resources, and third-party service providers.
